MODULAR ENGINEERS - AI QA CHECKLIST

Sample Project A | Recruitment Assessment

Purpose

Use this checklist as the internal QA policy for the prototype. The system should apply these rules when reviewing the supplied project documents.

Document & Revision Control

• Identify document type, drawing number, revision, issue date and status where available.

• Treat the latest clearly issued/current revision as authoritative unless another document explicitly supersedes it.

• Do not use a superseded revision to answer a question when a later current revision addresses the same item.

• If revision status is ambiguous, flag the item for engineer review rather than guessing.

Evidence & Citations

• Every engineering answer or finding must cite the source file and page. Drawing number/section/detail should be included where available.

• Distinguish direct evidence from inference. Do not present inference as a verified fact.

• If the answer is not supported by the supplied documents, state that it cannot be verified and identify what information is missing.

Cross-Document QA

• Compare architectural and structural information where relevant.

• Flag material, wall-system, geometry, level, load-path, dimension or detailing inconsistencies that may affect engineering coordination.

• When two current documents conflict, present both sources and escalate for engineer review.

Safety / Human Review

• AI findings are advisory only and must not be treated as final engineering approval.

• Consequential, uncertain or conflicting findings must be sent to Engineer Review.

• Recommended review states: AI Flagged -> Engineer Review -> Accept / Reject / Needs Correction.

Auditability

• Record the question/finding, evidence used, document revision, AI response, reviewer decision and timestamp.

• Keep superseded documents available for traceability but clearly label them as superseded.

Output Behaviour

• Prefer concise, evidence-led answers.

• Never fabricate dimensions, capacities, approvals, dates, standards compliance or engineering conclusions.

• Explicitly identify uncertainty and missing evidence.
