ENGINEERING AI QA - TEST QUESTIONS

Sample Project A | Use only the supplied test pack

Instructions

Run these questions through your prototype. For every answer, provide traceable source citations. Where the information is missing, conflicting or uncertain, the system should say so and route the item to human review where appropriate.

1. Revision Control

Which structural drawing revision should be treated as the current issue in this test pack? Explain why, and cite the evidence.

2. Wall-System Change

Identify a material or wall-system change between the superseded structural revision and the current structural revision. State the superseded description and the current description, and cite the relevant pages/drawings.

3. Architectural vs Structural Coordination

Compare the architectural wall-type information with the current structural drawings. Identify whether the wall-system information is coordinated, and flag any item that still requires engineer confirmation.

4. Current Design Certificate

What structural drawing revision is referenced by the supplied design certificate? Does it align with the current structural drawing set? Cite the evidence.

5. Certificate QA / Consistency Check

Review the design certificate for internal consistency. Identify any date, reference or supporting-document detail that appears unusual, inconsistent or requires verification. Do not assume it is correct merely because it appears on a certificate.

6. Missing-Information Test

Confirm the exact tested proprietary Ritek wall product specification, manufacturer design capacity and certified connection capacity applicable to every Ritek wall shown in the current structural drawings. If this cannot be verified from the supplied documents, state exactly what additional evidence would be required.

7. Evidence-First Answer

What concrete compressive strength is specified for suspended slabs, and where is this stated? Provide the source file, page and relevant schedule/section.

8. Human-in-the-Loop Finding

Create one AI QA finding from the supplied documents that should be escalated to Engineer Review. Show the finding, evidence, risk/uncertainty, recommended status, and reviewer actions available.
